- Geography
- Energy (Fossil fuel burning)
- Transportation

Heavy air pollution enshrouds Tiananmen Square in Beijing last month.

Despite massive efforts to improve Tianjin's pollution problem, the air quality in the city has actually gotten worse this year. In fact, recent data from the Ministry of Environmental Protection shows that Tianjin is one of the most polluted cities in China. (Not that we're surprised!)

Contemporary Challenges Case Study:

International Engineering Education Forum, Tianjin University, 11-12th December 2017

E.P. Byrne

- Chemical Engineering: emanated end 19th Century from need to understand both:
 - the **processes & chemistry** around fractionation of oil
 - the **design** and development of **safe** industrial-scale **processes** to carry this out.
- Chemical engineers are justly proud of their achievements in helping fuel the **industrial** and **social revolution** through the 20th Century with respect to **oil**, but also **food, drugs, chemicals**, etc. concurrent with a rapidly growing global population.
- One such product that chemical engineers are proud of is an oil derived product with a huge range of uses: **Plastic**

International Engineering Education Forum, Tianjin University, 11-12th December 2017

E.P. Byrne

What is Chemical Engineering?

Our modern society relies on the work of Chemical Engineers – they help manage resources, protect the environment and control health and safety procedures, while developing the processes that make the products we desire or depend on.....

Chemical Engineering is all about changing raw materials into useful products you use everyday in a safe and cost effective way. For example petrol, plastics and synthetic fibres such as polyester and nylon, all come from oil.

UN commits to stop ocean plastic waste

By Roger Harrabin
BBC environment analyst, Nairobi

🕒 5 December 2017 | 📄 90

f t m e Share

Nations have agreed that the world needs to completely stop plastic waste from entering the oceans.

The UN resolution, which is set to be sealed tomorrow, has no timetable and is not legally binding.

But ministers at an environment summit in Kenya believe it will set the course for much tougher policies and send a clear signal to business.

Points to ponder:

- Do chemical engineers bear a **moral** and **ethical responsibility** for the **'unintended' consequences** plastic bring?
- Do we have a responsibility to take a **broader view** e.g. develop and promote **alternative materials** to oil based plastics? e.g. *biodegradable plastics produced from polymerized lactic acid bacteria?*

EDUCATION tce

Educating the chemical engineer of the future

Sustainability needs to quickly become the context for 21st century chemical engineering education, argues Edmond Byrne

The 21st century promises to present humankind with an unprecedented confluence of global challenges, all emanating from an unsustainable societal contract. These include global energy, water and food security, exacerbated by accelerated climate change; constant elements for a 'perfect storm' as described by John Houghton, the UK government's chief scientific adviser last year. Social inequality and economic turmoil only promise to aggravate the situation.

Sustainability presents a myriad of definitions, but for its clarity and simplicity it's hard to beat that of MIT chemical engineering professor emeritus John Houghton, who suggests that sustainability is "the possibility that humans and other life will flourish on Earth forever". Based on words expressed through any of the metrics that abound regarding ecological, environmental, social and even economic measures, one would be hard pressed to argue that the current societal contract is sustainable by this definition.

A unique perspective Chemical engineers, with their inherent understanding of material and energy balances and the second law of thermodynamics, can appreciate how any economic societal contract that does not consider the earth as a whole and materially-based system is ultimately doomed to failure. A world based on 'end of pipe mitigation' or for that matter, one which only strives for increased efficiencies while ignoring the reality of capacity limits, will not present a sustainable contract. As Houghton points out, "reducing unsustainability, although critical, will not create sustainability. Instead, the existing paradigm of ever increasing consumption of everything (material, energy, etc) must be replaced by one which recognizes the earth's (physical) resource limits (see Figure 1). As we increasingly press against these limits, the call for such change is becoming ever more urgent in the context of our complex ecological, social and economic world, as the first macroeconomic budget

design project example

An example application of a sustainability embedded approach involves the traditional chemical engineering capstone design project, typically a group design of an industrial process to produce some given chemical/pharmaceutical food product. As part of the design the group typically considers possible alternative processes to produce the product and then chooses and design

they remain firmly within the constraints-driven paradigm of traditional chemical engineering practice. As a result of this the student is only challenged to compare one unsustainable system with another less unsustainable system. A more appropriate question from a standpoint whereby sustainability is context might not be simply "What is the best way to produce vinyl chloride?"

International Engineering Education Forum, Tianjin University, 11-12th December 2018

E.P. Byrne

Year 1: PE1006 Professional Engineering Communication & Ethics

Wicked Problem Group Assignment

Wicked Problems: Complex messy societal problems where people often cannot agree on what the problem is (framing) and which do not lend themselves to solving through simple deterministic interventions.

Task: Research. Frame problem according to different perspectives (techno-optimistic, local/community, global(ised), techno-critical, integrative, etc.) Identify problematic issues/potential unintended consequences with each framing.

International Engineering Education Forum, Tianjin University, 11-12th December 2018

E.P. Byrne

Year 2: PE2004 Communication in Engineering

Module Objective:

To improve students' skills in communicating and presenting complex technical information both to technical audiences and to the public at large.

E.P. Byrne

Year 4: PE4006 Design Project

'Embedding Sustainability' into the final year capstone Design Project

Traditional 'end of pipe'
approach

Do the design first

Then perform sustainability
assessment at the end

This philosophy seems to be somewhat 'upside down':
Sustainable assessment should NOT just be a "bolt-on" activity, but should be incorporated throughout the design process in a way that recursively influences design decisions and the final outcome.

International Engineering Education Forum, Tianjin University, 11-12th December 2018

E.P. Byrne

Revised approach to placing sustainability as context of design project requires:

a) Considering sustainability throughout a (semi open ended) design process

-Thus feed into design decisions from start, including framing

b) Environmental aspects

-Employ scientific/engineering tools and methods which can have a real impact and can directly influence the design (e.g. LCA, EIS, material and energy balances)

c) Socio-economic aspects

- More difficult and possibly outside scope (e.g. societal structural issues).

It could be argued that the key sustainability 'game-changers' lie in the broader socio-economic domain; aim is to challenge to consider broader sustainability education and at least identify key problematic issues. Ideas?

International Engineering Education Forum, Tianjin University, 11-12th December 2017

E.P. Byrne

Educating the chemical engineer of the future

Sustainability needs to quickly become the context for 21st century chemical engineering education, argues Edmond Byrne

The 21st century promises to present humankind with an unprecedented confluence of global challenges, all emanating from an unsustainable current course. These include global energy, water and food security, exacerbated by accelerated climate change, constituent elements for a 'perfect storm' as described by John Hiddington, the UK government's chief scientific adviser last

will flourish on Earth forever? Based on trends expressed through any of the metrics that abound regarding ecological, environmental, social and even economic measures, one would be hard pressed to argue that the current societal construct is sustainable by its definition.

a unique perspective
Chemical engineers, with their talent

design project example

An example application of a sustainability embedded approach involves the traditional chemical engineering capstone design project, typically a group design of an industrial process to produce some given (chemical/pharmaceutical/food) product. As part of the design the group typically considers possible alternative processes to produce the product and then chooses and design a suitable process having analysed and compared the available processes subject to a number of constraints, including economic, environmental, safety, availability, and so on. A commonly quoted example is the production of the vinyl chloride monomer (VCM), the precursor to the poly vinyl chloride (PVC) polymer. Here, as part of the design exercise, students may be required to investigate two options; one with an ethylene raw material, the other using acetylene. As part of this, a number of novel unit operations may be considered which lead to a reduction in volatile organic compound (VOC) emissions in one process compared with the other. The system can then be extended to incorporate raw materials and PVC production and a lifecycle analysis can be undertaken. While these are interesting and in many ways innovative approaches,

they drive engineers to be challenged to compare one unsustainable system with another less unsustainable system. A more appropriate question from a standpoint whereby sustainability is context might not be simply: "What is the best way to produce vinyl chloride?" but instead: "Design a process to produce a material with the properties of PVC." This turns the design question on its head and opens up many potentially innovative possibilities while empowering the students' learning. It provokes follow-on questions among the design team, such as: "Are there materials, and corresponding processes, other than MVC/PVC that can take their place, that are sustainable, or at least, less unsustainable?" Could for example, lactic acid, and the resultant biodegradable plastic polymeric lactic acid (PLA) take the place of PVC for many applications? Or "In general, how feasible is it to produce plastics from renewable materials as opposed to oil?" "What are the technical and economic barriers preventing for example, the production of biodegradable polymeric materials to meet the required specifications?"

E.P. Byrne

Framing Considerations:

Might students propose reframing a design project which requires the production of plastics or VCM, a PVC precursor, to one which would produce inherently 'more sustainable' non-oil based plastics, such as a biodegradable plastics? This too could have longer-term positive economic (sustainability) implications for a plastics business..

International Engineering Education Forum, Tianjin University, 11-12th December 2017

Moreover,

- In siting and designing the plant, might students consider broader issues such as low carbon/healthy **transportation** options: safe/easy walking and cycling access and/or frequent and efficient public transport routes.

Consider aspects such as:

- local **community** involvement?
- family friendly **working** shifts and practices?
- on-site natural **amenities** (wetlands, groves, walkways, etc.) ?
- on-site **renewable energy** production?

Also, what are possible economic, policy or socio-technical barriers to such initiatives?
